Shield Insurance Project

By Fathima Ashraf

Company Overview

- Shield Insurance operates in the insurance domain, where it offers various policies to customers across different segments and generates revenue primarily through collected premiums.

Problem Statement

Shield Insurance lacks a centralized system to monitor revenue trends and understand customer segmentation and evaluate how different age groups and sales modes contribute to overall business performance.

The absence of clear visual insights makes it difficult to identify patterns and drive better decisions

Project Objectives

The objective of this project is to develop an interactive Power BI dashboard for Shield Insurance that provides key performance indicators (KPIs) such as total customers, total revenue, daily growth rates, and monthly trends.

The dashboard aims to enable customer segmentation and provide detailed analysis of revenue and customer distribution across cities and sales modes, along with interactive filters to support efficient and data-driven decision-making.

Dataset

- The dataset consists of 5 tables: 3 dimension tables and 2 fact tables.

-dim_customer

-dim_date

-dim_policies

-fact_premiums

-fact_settlements

All of these were provided as csv files

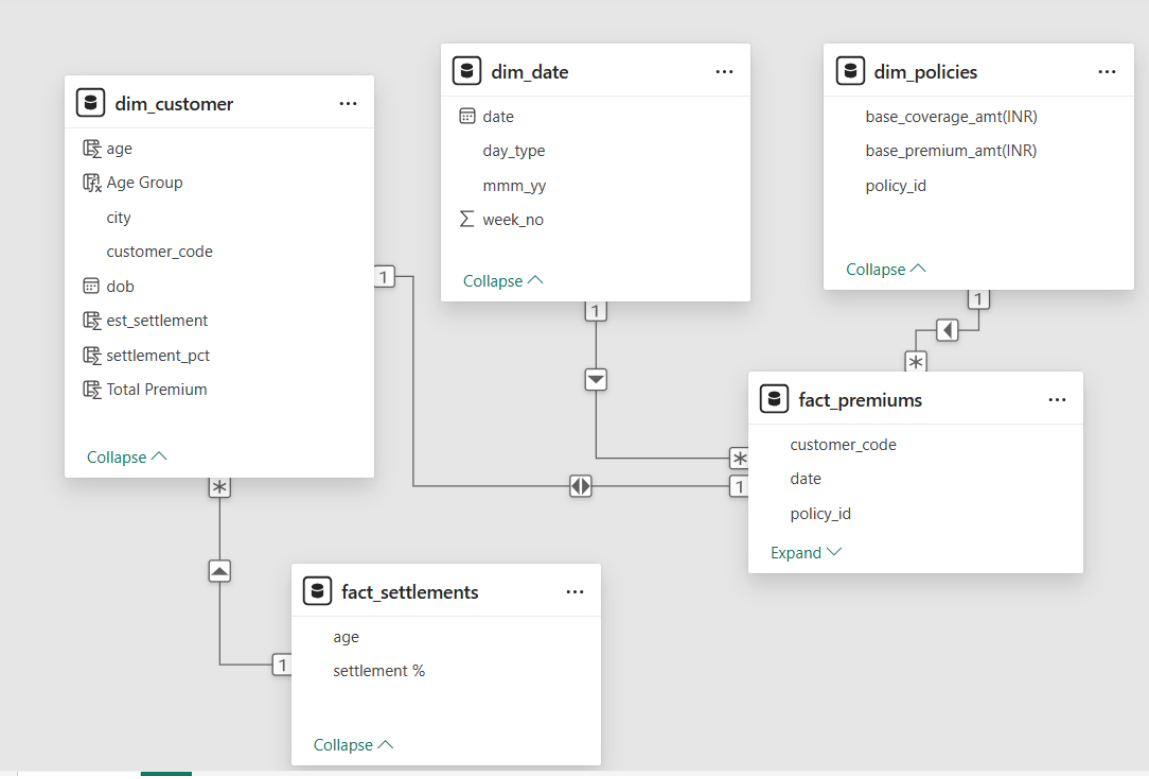
Solution Approach

A feature list was initially created by categorizing the requirements into high-priority and low-priority tasks to ensure a structured and efficient development process.

Based on these requirements, a mockup of the dashboard was designed and finalized after client approval, following which the dashboard development was carried out in Power BI.

Stages of Dashboard Development

- Initially, the data was thoroughly validated to check for accuracy, missing values, and inconsistencies to ensure reliability before proceeding with the analysis.
- This was followed by data modeling, where relationships between dimension and fact tables were established to create a structured data model.
- Finally, key metrics and KPIs were created using DAX to support analysis and visualization in the dashboard.



- This is the data model used to connect customer and transaction data

KPI’s

Total Customer

Total Revenue

Daily Growth Rate

These are key KPIs used in the dashboard to track performance

Dashboard Design

- The dashboard was structured into three main views, including an general view, a sales mode analysis view, and an age group analysis view, to provide focused insights from different perspectives.

dashboard

Insights

- Revenue shows a strong upward spike in March (~264M) after relatively stable months, followed by a noticeable drop in April, indicating possible seasonality or campaign-driven performance.
- Offline-Agent channel dominates both customer acquisition (~55%) and revenue contribution (~550M), while Online channels are growing steadily but still underperform in comparison.
- The 31–40 age group is the highest contributor across customers and expected settlement (~439M), making it the most valuable segment, whereas younger (18–24) and older (65+) groups contribute significantly less.
- Delhi NCR leads in both revenue (~402M) and customers (~11K), suggesting it as the strongest market, while cities like Indore and Chennai show relatively lower performance and potential growth opportunities.

Recommendations

- Focus on scaling high-performing months like March by identifying what drove the spike (campaigns, offers, or channels) and replicating those strategies to reduce the April drop.
- Strengthen online channels (App & Website) through targeted digital marketing and better user experience, since they show growth potential but lag behind Offline-Agent performance.
- Prioritize the 31–40 age group with personalized products and campaigns, while designing specific strategies to engage underperforming segments like 18–24 and 65+.
- Invest more in top-performing regions like Delhi NCR while creating targeted expansion strategies (local campaigns, partnerships) to improve performance in weaker cities like Indore and Chennai.

Conclusion

- This dashboard gives a simple and clear view of revenue, customers, and overall business performance across different months, channels, age groups, and cities. It helps us understand which channels, customer groups, and locations are performing well and which ones need improvement. These insights make it easier to take better decisions based on data. Overall, the dashboard helps in improving performance and achieving steady business growth.

THANK YOU
